

QUESTION		ANSWER
1. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
2. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
3. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
4. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
5. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
6. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
7. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
8. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
9. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy
10. A patient with a long history of alcohol abuse presents with a severe headache, vomiting, and confusion. The patient's vital signs are stable, but the physical examination reveals nystagmus and ataxia. What is the most likely diagnosis?		Wernicke's encephalopathy

ANSWERS

1. Wernicke's encephalopathy
2. Wernicke's encephalopathy
3. Wernicke's encephalopathy
4. Wernicke's encephalopathy
5. Wernicke's encephalopathy
6. Wernicke's encephalopathy
7. Wernicke's encephalopathy
8. Wernicke's encephalopathy
9. Wernicke's encephalopathy
10. Wernicke's encephalopathy
