## 1 - Read Over Fence Instructions First

Your gate and fence will work better together as an integrated solution if you first take the time to read and understand your fence instructions.

## 2 - Pre-Assemble the Gate Frame (without pickets)

Please do not screw your gate frame together until you have first temporarily assembled the gate. In other words, do a dry run first.

This will ensure three things:

- a) *That you have everything necessary to complete the gate.*
- b) *That you will have assembled the gate in the correct order.*
- c) *All the pieces fit and function properly.*

It's easier to trouble shoot when things are not screwed together. After you assemble your gate correctly, please disassemble as necessary and use screws to permanently assemble the gate.

## 3 - Ideally, Install Your Gate Posts Before Your Fence Posts

Your fence panels will be more forgiving for a custom fit than your gate. Ideally, position and install your gate posts before you do anything else, or very early on in the process of setting up your fence run.

## 4 - Ideally, Do Not Hang Your Gate System Off a Single Non-Supported Post

Your gate will perform better and last longer if your hinge post is connected to a panel of fence which is connected to another post. The weight strain will be transferred unto two posts versus just one. Installing fence panels on both sides of your gate is the ideal in all situations. If this is not possible because of space restrictions, please contact us for alternative solutions to overcome.
