COLOR ADJUSTMENT TIPS

1. The colors can be made darker by adding more tint or less putty to your mixture.
2. The Colors can be made lighter by adding more putty or by adding the clear lacquer to your mixture.
3. To slightly alter colors, add tint to some fresh putty first, then add that to your existing mixture.

CREATING GRAINING OR MARBLING EFFECT

After repair is complete - and before applying lacquer - add your graining or marbling:

1. Mix tints in the bowl to closely match the graining or marbling. It's better to start lighter than darker.
2. Always start with light colors then add dark colors.
3. Add lacquer or water to reduce the strength of the color, if needed.
4. Place 3 drops of the lacquer onto the mixing board surface.
5. Pull the cotton away from one end of the swab, creating a fine strand, like a fine paint brush.
6. Lightly dip the cotton strand in the tint bowl, being careful not to dip the whole swab.
7. Draw the strand once or twice through the lacquer on the mixing board.
8. Lightly create graining or marbling with the fine strands over the repaired area.
9. Allow to dry and apply a coat of clear lacquer over.

TIP: Test graining on a scrap piece of putty to get the look you want.

CAUTION: EYE IRRITANT Read instructions carefully

INSTRUCTIONS

The putty mixture dries much darker, so wet mixture should be much lighter than your final desired shade. When mixing, test a small amount of mixed putty on a scrap of cardboard, or on an inconspicuous area of vinyl before applying to repair area.

Use a hair dryer to allow quick color testing and speed drying of applications. Mixture usually needs adjusting to ensure a good color match.

PREPARATION

All surfaces should be clean and dry. **Shake all pigment bottles thoroughly before and during use.**

MATCH & MEASURE

1. Choose a color from the formula chart found **inside front label** that most closely matches the vinyl.
 - For a more realistic repair, match the background color (usually much lighter) first, then add foreground graining or marbling.

2. Measure the required amount of putty onto the mixing board.
3. Follow directions for the Mixing Method (A or B) which applies to your formula.

METHOD A: MIX IN BOWL

Add the required amount of tint drops into the bowl and mix thoroughly with the stick. Dip stick in bowl and apply mix to mixing board with a sharp tap - see photograph. Next blend until putty is uniform in color.

1) Squeeze required amount of putty onto mixing board

2) Drop tints into mixing bowl

3) Mix tints well

4) Dip mixing stick into the bowl and tap onto board

METHOD B: DROPS INTO PUTTY

Add tint drops listed in the formula directly to the putty. Next blend until putty is uniform in color.

Drop tints directly into putty.

MIX & APPLY

BLEND WELL

APPLY

APPLICATION

1. Apply mixture to vinyl with the plastic spatula, slightly overfilling the area of repair. Scrape off any surrounding excess with spatula. Allow to dry 2-3 hours.
2. When the mixture is freshly dry, gently rub away the excess of the surrounding area with a damp cloth until the surface is smooth.
3. If shrinkage occurs, re-apply the above mixture.
4. Once the repair is completely dry (8-12hrs) and graining or marbling is finished, apply clear lacquer over the area using the brush.
5. Allow to fully cure before heavy use (2-3 days).

Hint: Cover extra mixture with plastic wrap to save for a second application or for future use.

CAL FLOR

HINTS & TIPS

- To save time, pre-fill deep gouges with untinted putty and let dry before topping off with final matching color.
- Save all putty mixes (including tests) under plastic wrap or on cards for 2nd application, marbling tests, etc.
- For very fine repairs, trim brush to make it smaller before applying lacquer.
- Cut off the back panel of package and use it as a mixing plate.
- Putty will darken greatly as it dries, so ALWAYS test small amounts as you go.
- For minor scratches, try CalFlor's ScratchAway concealer or ScratchCure Repair Pens.
- Always test graining on a scrap piece of putty.
- For a more realistic repair, match the background color (usually much lighter) first, then add darker foreground graining or marbling.
- Final lacquer application can darken some formulas.
