

ANATOMY

Structure	Function
Cornea	Refracts light entering the eye.
Iris	Controls the amount of light entering the eye by adjusting the size of the pupil.
Pupil	Opening through which light passes.
Lens	Refracts light further to focus it on the retina.
Ciliary muscles	Contract and relax to change the shape of the lens for focusing.
Vitreous body	Fills the eye and helps maintain its shape.
Retina	Receives light and converts it into neural signals.
Optic nerve	Transmits neural signals to the brain.
